Unsettled week ahead

Author: Press Office
11:54 (UTC+1) on Tue 15 Oct 2024

Mild and humid conditions will give way to further spells of wet and windy weather.

Southerly winds across western Europe are transporting a warm and humid airmass from the western Mediterranean and northwest Africa across the UK over the next couple of days. As this clears on Thursday, Atlantic frontal systems will bring further spells of wet and windy weather into the west at times later in the week.

Met Office Chief Meteorologist Neil Armstrong said: “Warm air arriving from the south will allow temperatures to rise above average despite it often being cloudy. On Wednesday, parts of southeast England could see 21°C or 22°C, with mid to high teens expected across many parts of the UK. However, there is accompanying rain as part of this system in what is a wet day for many western and northern parts of the UK, before drier conditions develop on Thursday.”

Warnings for rain are in force for Wednesday, with travel disruption possible for some.

Further ahead

As we go through the rest of the week, we will see further bands of rain or showers moving across the country at times, and although temperatures will trend down a little it will generally remain mild for the time of year.

Met Office Deputy Chief Meteorologist, Dan Holley, said; “A low pressure system could bring strong winds to the north and west on Friday. This combined with high spring tides may result in some coastal impacts, potentially continuing into the weekend on some coasts. Warnings for Friday and later in the weekend have already been issued and will continue to be refined and reviewed in the coming days.

"As we head into the weekend the weather will remain unsettled with further rain at times, and by Sunday, there is a chance that a particularly deep area of low pressure arriving from the Atlantic could bring more widespread strong winds, especially in northern and western areas, with potential for some disruption in places.

"This low-pressure system is not expected to develop until Friday near the coast of Canada, so at this stage there is still a lot of uncertainty about the strength and track of this system as it interacts with the jet stream over the weekend. It's likely that Sunday's wind warning will be updated and refined as confidence increases, so stay up to date with the latest forecast."
